

Multimodal passengers of the future – passenger needs, expectation

Modus project

Workshop 'Passenger-centred Mobility'

ART/ACARE/CAMERA

Online, June 16, 2021

Modus

Founding Members

This project has received funding from the SESAR Joint Undertaking under the European Union's Horizon 2020 research and innovation programme under grant agreement No 891166.

Modus Objectives and Consortium

The high-level objective of Modus is to analyse how the **performance of the overall European transport** system can be optimized by considering the entire **door-to-door journey holistically** and considering air transport within an **integrated, intermodal approach**.

Website: <https://modus-project.eu/>

Modus

Call: ATM Role in Intermodal Transport (H2020-SESAR-ER4-10-2019)

Grant no. 891166

Duration: June 2020 – November 2022

Understand

in a better way how ATM and air transport can better contribute to improve passengers' intermodal journeys and how this translates into an enhanced performance of the overall transport system

Explore and model

the connection and dependence between ATM/air transport and other transport modes, with a special focus on the interplay between short and medium air and rail connections

Identify

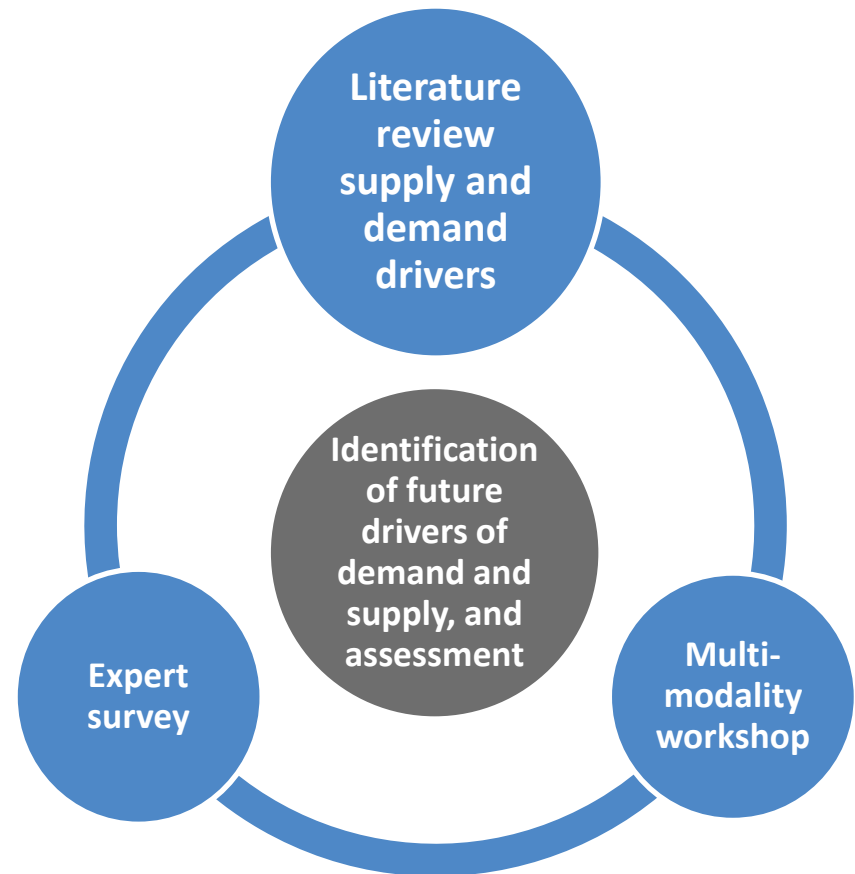

the main barriers in achieving European (air) mobility goals and how air transport can evolve by efficiently connecting information and services with other transport modes to achieve the 4 hours door-to-door goal and a seamless journey experience for passengers.

Drivers of Multimodal Passenger Demand

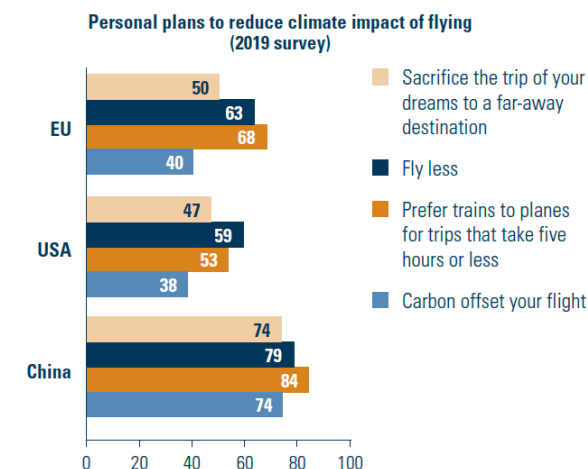

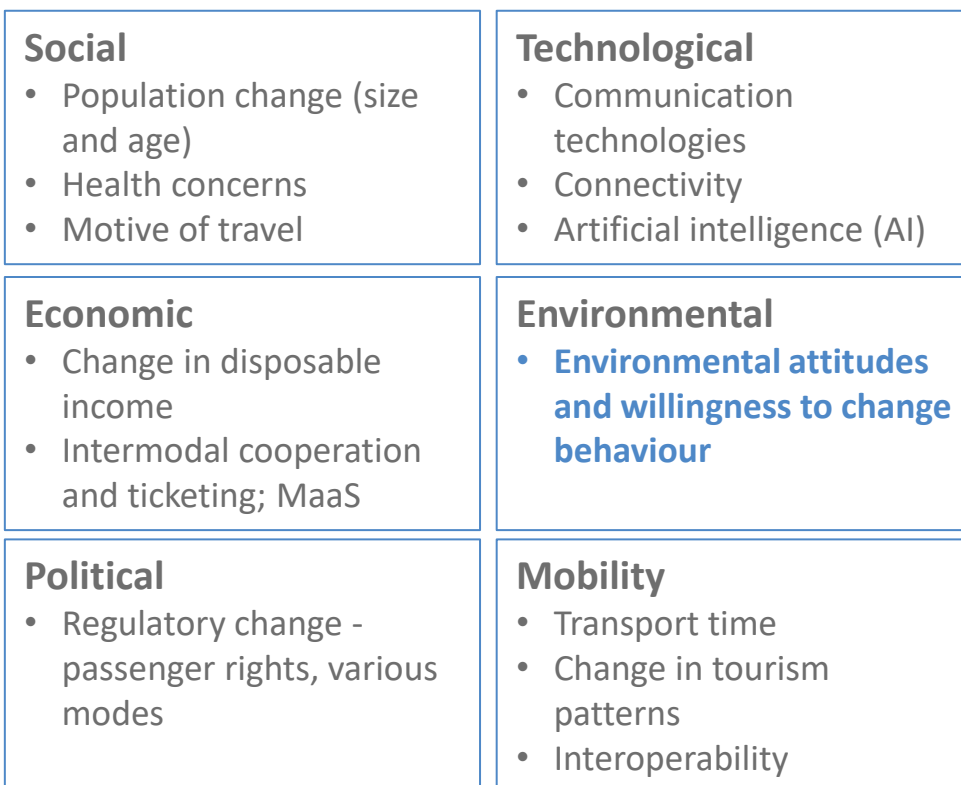

Manifold challenges ahead!

- Enabling a **seamless passenger journey**, including multiple providers and information
- Meeting **environmental goals** and facilitating a sustainable transport system
- Identifying and developing **new business models** that enable a multimodal transport system
- Tackling the **implications and changes** resulting from **COVID-19**
- Rethinking the use of current **infrastructure** and future challenges
- ...

Modus approach: Supply and demand analysis

Selected Passenger Demand Drivers

Source: Modus D3.1, Bauhaus Luftfahrt Yearbook 2019; EIB 1st and 2nd climate survey, <https://www.eib.org/en/surveys/index.htm>

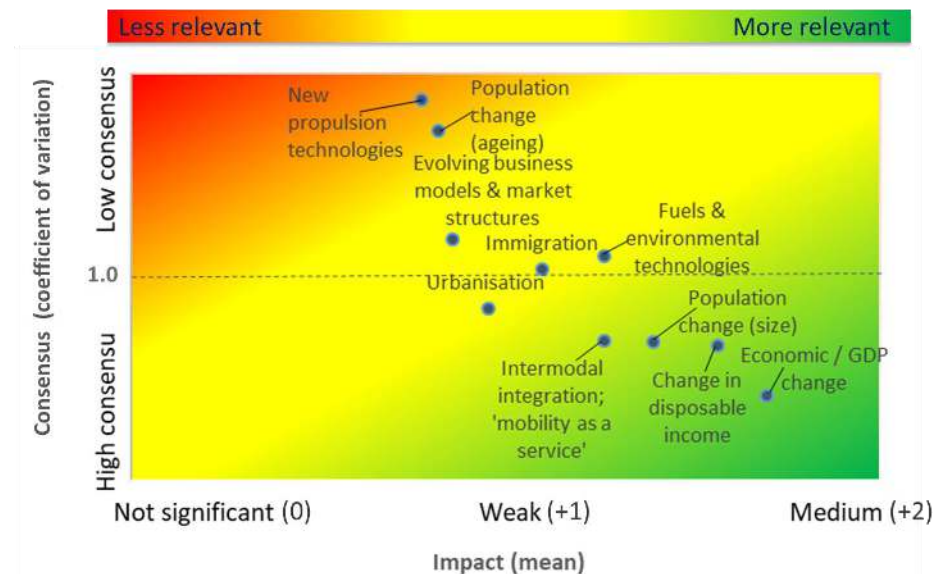

Expert assessment: Impact on air travel demand

Supporting **economic factors** as strong drivers for future demand

Intermodal integration and **Mobility as a Service** shaping the future transport system

Passenger **environmental attitudes and environment-related regulation** are expected to boost rail supply and demand further

Assessment of drivers for air travel demand

This analysis only includes those factors which are considered to lead to an increase in air travel demand by the experts; factors assumed to have a negative impact are not depicted here since there is very low consensus across experts in regard to factors.

Expert assessment: Future mobility solutions

Rail transport playing a major role in **future multimodal transport**

More investment in **combined air-rail solutions** expected

Travel for **business purposes** expected to grow less than for leisure

Covid-19 recovery: experts expect faster recovery for rail sector compared to air

Air and rail travel solutions by 2040

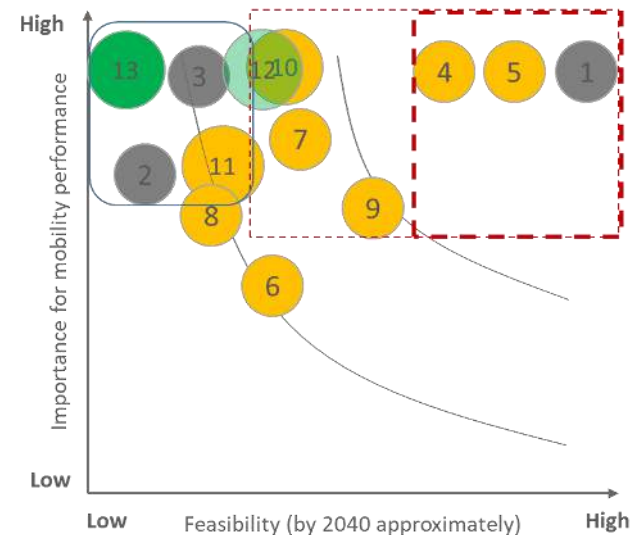

Source: Modus D3.1

Moving towards a **truly multimodal European transport** system

- **Data as key enabler** for improvement (sharing across providers, security and privacy, initiation of shared platforms).
- Focus on **regulations** which are an important foundation to introduce multimodal solutions.
- **Passenger focus of utmost importance** when considering infrastructure needs, business models, and door-to-door journeys.

Future passenger needs and potential improvements

1 Regulations

4 Journey planning

5 Booking and ticketing

9 Personalisation of travel

7 Ticketing innovations

10 Accessibility and comfort

12 Green travel

Source: Modus D3.1

Impact on the (Future) Transport System

Possible effects of **changing environmental awareness** and **regulations** on demand for air transport

- Carbon off-setting approaches
- Substitution away from air to rail
- Less air travel on short-haul routes
- Moving towards more efficient complementarity between air and rail

The screenshot shows a flight search results page for the route MUC-LAX. The 'Am wenigsten CO2' (Least CO2) option is highlighted with a red circle. The page displays flight details, prices, and CO2 emissions for various airlines.

Option	Price	Duration	CO2 Emissions
Günstigste Option	448 €	16:55 Std.	
Beste Option	448 €	16:55 Std.	
Am wenigsten CO2	1.470 €	17:32 Std.	

The highlighted 'Am wenigsten CO2' option shows a flight from MUC to LAX with a duration of 17:32 Std. and a price of 1.470 €. The flight is operated by Virgin Atlantic and British Airways. The page also displays a section for '4.310 kg ist der durchschnittliche CO2-Ausstoß auf dieser Strecke.' (4,310 kg is the average CO2 emission on this route).
